

THE MARKET FOR THE NEXT 30 MINUTES OF ATTENTION

Attention Bid transforms a continuously renewing unit of digital attention into an open, observable market - where price is discovered through competition, the winner controls the next block, and the auction itself becomes part of the content.

COMPANY UPDATE

Attention Bid is now incorporated.

Attention Bid, Inc. is a Delaware C corporation responsible for operating the platform, owning company intellectual property, pursuing partnerships and financing, and building the next stage of the attention marketplace.

VERSION 6.1 - SEPTEMBER 2026

INFORMATIONAL DISCUSSION DRAFT - NOT AN OFFER TO SELL SECURITIES OR TOKENS

01 / ABSTRACT

A new market primitive for digital attention

Attention Bid operates a perpetual auction for a scarce, time-bounded digital resource: control of the platform's primary attention surface. Each 30-minute block is allocated through competitive bidding. When one block ends, the next market begins.

The product combines digital advertising, auction-based allocation, and crypto-native settlement in a consumer-facing market. The central innovation is not simply that attention is auctioned. The bidding, price discovery, countdown, winner, payment receipt, and transition of control are visible parts of the experience.

02 / MARKET THESIS

Attention is valuable. Time is scarce. Markets discover prices.

Businesses already allocate enormous capital to acquiring digital visibility. Attention Bid narrows that broad market into a defined inventory unit - its own next 30-minute homepage block - and asks participants to reveal what that specific interval is worth.

CONVENTIONAL ADVERTISING

Allocation is mostly hidden

A platform, network, or algorithm usually determines placement. The audience sees the result but rarely sees the market that selected it.

ATTENTION BID

The market is part of the product

Current bids, time remaining, winning price, payment receipt, winner, and content transition can all be visible.

03 / THE PERPETUAL AUCTION

One scarce block. Continuous renewal.

Each block is unique because a past time interval cannot be recreated. Scarcity renews because another future interval opens immediately after the current one. This creates a recurring product cadence and a continuing opportunity to participate.

OPEN BLOCK

BID USDC

NEXT BLOCK

04 / PRICE DISCOVERY

USDC value plus verified QUIET bid power.

User bids are ranked by effective bid: $\text{USDC bid} \times \min(10, 1 + \text{QUIET held} / 1,000,000)$. One million QUIET adds one unit of power, while nine million reaches the 10x maximum. Fractional balances apply proportionally. The USDC transfer remains the amount actually paid.

BID POWER VAULT

Non-custodial balance snapshot

At bid recording time, the server verifies the connected wallet's current QUIET balance. Tokens stay in the holder's wallet and are not transferred or locked.

IMPORTANT LIMITATION

Snapshot is not an on-chain lock

A holder can move tokens after a bid or between wallets. A true deposited vault would require a separately deployed and audited Solana program.

05 / GROWTH ENGINE

The competition can market the auction.

The growth hypothesis is reflexive: more viewers can make a block more useful; greater usefulness can attract more bidders; more competition and unexpected outcomes can create new reasons to watch and share. This thesis must be tested with retention, repeat bidding, referral, close-time traffic, and click-through data.

06 / SOLANA AND USDC

Verifiable settlement for a dollar-denominated auction.

USDC is the bidding asset and Solana provides transaction infrastructure. A winning bid of 500 USDC therefore communicates approximately 500 dollars of nominal bidding value, making historical auction prices easier to interpret than if bids were denominated only in a volatile project token.

PAYMENT VERIFICATION**Exact transaction checks**

The application verifies network, USDC mint, sender, treasury destination, amount, confirmation, and transaction reuse before recording a user bid.

WALLET AUTHENTICATION**Signed ownership challenge**

Winning wallets sign a message to prove control before publishing content. Signing does not authorize a payment or fee.

07 / OPERATING CONTROLS

Automation should be visible and limited.

The live beta includes a disclosed operator-funded house bidder that can enter an otherwise empty round after ten minutes. The house wallet is separate from the revenue treasury, subject to a spending cap, and labeled wherever its bid or content appears.

CONTROL 1**Treasury separation**

Revenue, operating funds, and automated bidding funds should remain in distinct wallets.

CONTROL 2**Content controls**

Winner content can be hidden or rejected by the operator when necessary.

CONTROL 3**Public receipts**

On-chain transaction links allow payment claims to be independently checked.

CONTROL 4**Key security**

Private keys should never be committed to source control or exposed to the browser.

08 / ATTENTION BID, INC.

A Delaware corporation now operates the project.

Attention Bid, Inc. was incorporated in Delaware in 2026 to operate the platform, own company intellectual property, contract with service providers and partners, employ contributors, manage company assets, and pursue financing under formal corporate approvals.

FOUNDER STOCK IS NOT THE SAME AS COMPANY VALUATION

A founder's nominal purchase price for restricted common stock records the initial issuance under the company's formation documents. It does not by itself establish the price investors would pay, the company's enterprise value, or a guaranteed economic return. A future financing establishes its own negotiated terms and ordinarily dilutes existing ownership when new securities are issued.

09 / FUNDING PATHWAYS

Financing must follow a documented exemption or registration path.

PRIVATE FINANCING

SAFE or priced equity round

The company may negotiate financing with investors using board-approved documents and an available securities-law exemption. Proceeds paid to the company fund the company; a founder secondary sale does not.

COMMUNITY FINANCING

Regulation Crowdfunding

A public crowdfunding round must run through a registered intermediary with Form C disclosures, offering limits, financial information, advertising constraints, and ongoing reporting.

NON-DILUTIVE CAPITAL

Grants and commercial revenue

Ecosystem grants, sponsorships, paid pilots, and auction revenue can finance development without issuing additional company securities, although each source still requires appropriate accounting and contracts.

PUBLIC WEBSITE

Factual company information

The website can describe the company and product. It should not publish investment terms or accept investment funds until counsel selects and documents the offering pathway.

10 / SHARES AND TOKENS

Putting shares on-chain does not remove securities laws.

The SEC describes an issuer-sponsored tokenized security as a security whose ownership record is maintained in whole or in part through a crypto network. The technology changes the recordkeeping format, not the legal nature of the share.

POSSIBLE LATER STRUCTURE**Tokenized company security**

Attention Bid could explore issuer-sponsored tokenized shares with securities counsel, board and stockholder approvals, a compliant transfer system, identity controls, investor records, custody design, disclosures, and an available offering exemption or registration.

NOT A TECHNICAL CONVERSION**Shares do not simply vest into tokens**

Founder vesting determines when repurchase restrictions lapse. Tokenization is a separate corporate and securities process. Any exchange, redemption, or representation of shares must preserve the holder's legal rights and the company's official stock ledger.

11 / CURRENT TOKEN POSITION

QUIET utility does not represent Attention Bid equity.

The current product can use the separately issued QUIET token only to calculate bid power. Holding QUIET does not grant Attention Bid shares, company revenue, dividends, governance rights, or a future company token. No website visitor should rely on a future equity-token launch. Any later design would require new governing documents, technical security review, tax analysis, and a documented legal pathway before announcement or sale.

SEPARATE COMMUNITY ASSETS

QUIET bid power is a product utility calculated from a wallet-balance snapshot. It does not make QUIET an Attention Bid share. Any proposed holder rewards, revenue sharing, redemption, or exchange for company securities must be separately authorized, documented, and reviewed before launch.

12 / EXECUTION ROADMAP

Prove the market before expanding the financial layer.

1. LIVE BETA

Improve mobile wallet access, reliability, moderation, analytics, and bidder onboarding.

2. AUDIENCE

Launch a branded domain, publish searchable company content, grow X and Telegram, and measure referrals.

3. FUNDING

Organize the cap table, company bank and wallets, accounting, data room, and counsel-led financing materials.

4. TOKEN REVIEW

Only after product traction: determine whether any token has a necessary function and a viable legal structure.

13 / PRINCIPAL RISKS

Adoption and revenue may remain limited. Network effects may not develop. Bids and token values can be volatile or illiquid. The product depends on Solana, USDC, wallets, RPC providers, hosting, and database infrastructure. Content may create moderation and legal exposure. Automated wallets create key and treasury risk. Financing dilutes existing stockholders. Securities, commodities, money-transmission, sanctions, privacy, advertising, tax, and consumer-protection rules may apply depending on the final facts.
